Frontend Engineer (India)
VectorShift — Y Combinator (S23)
Remote, India

Dear VectorShift Hiring Team,

I am writing to apply for the Frontend Engineer (India) role at VectorShift. I recently completed my B.E. in Information Technology from MVSR Engineering College in Hyderabad, and I am looking for a frontend-focused role at an early-stage company where I can build intuitive user interfaces for technically ambitious products. VectorShift's mission — making custom AI workflows accessible through a no/low-code platform while also serving developers via API and SDK — is exactly the kind of product challenge that excites me.

During my **Front-end Engineer Internship at RCI**, I built user-facing web features using Django templates, HTML5, CSS, Bootstrap, and JavaScript. I implemented responsive layouts and form-driven workflows, collaborated with backend developers on requirements and API contracts, and iterated on UI fixes based on stakeholder feedback. This experience taught me how front-end decisions directly affect usability — and how closely frontend and backend teams need to align when shipping features.

At **CloudSire Solutions**, I worked as an Integration Engineer building **REST API** connections across Salesforce, Jira, Mailchimp, ServiceNow, Slack, and Outlook. While this was not a pure frontend role, it strengthened my ability to understand API contracts, debug end-to-end data flows, and ship reliable integrations with **Git**-tracked, iterative delivery — skills that translate directly to consuming backend services from a React application.

I have also built full-stack projects that span UI and API layers. My major project, *Bridging Learning Gaps*, is a Flask-based web application with a browser UI, REST endpoints, and live video processing — I owned the flow from user interaction through backend processing to results display. Separately, I have built **React** applications in academic and personal projects, working with component state, hooks, and responsive CSS. At **Samyama.ai**, I contributed to **Python/FastAPI** backend services, which helps me collaborate effectively with backend engineers on your FastAPI stack.

I want to be direct about where I am still growing. I do not yet have production experience with **Next.js** or **TypeScript**, and my React work has been primarily through internships, coursework, and personal projects rather than years of production frontend ownership. I also do not have a formal UI/UX design portfolio. What I bring is genuine enthusiasm for frontend craft, proven

ability to ship web features and API integrations, startup exposure through Poditivity's Founder's Office, and the willingness to learn quickly in a small team — including ramping on Next.js, performance optimization, and the UX demands of a no/low-code platform.

I am based in **Hyderabad** and am fully comfortable with **remote work across India**. I would welcome the opportunity to contribute to VectorShift's frontend while growing into the architecture and UX ownership the role describes.

Thank you for considering my application. I look forward to discussing how my front-end internship experience, API integration background, and full-stack project work can support VectorShift's platform.

Sincerely,
Sankeerth Masetty
