Junior Software Engineer — Remote (Global)
MixRank — Y Combinator (S11)
Remote (Global)

Dear MixRank Hiring Team,

I am writing to apply for the Junior Software Engineer — Remote (Global) role at MixRank. I recently completed my B.E. in Information Technology from MVSR Engineering College in Hyderabad, and I am looking for a generalist engineering role where I can work on technically ambitious problems — especially data pipelines, backend systems, and machine learning — at a company that values programming as a craft. MixRank's scale (petabytes of crawled data, custom distributed systems, full APK/IPA analysis) is exactly the kind of environment where I want to grow.

At **Samyama.ai**, I worked as an SDE intern building **Python** backend services with structured JSON APIs, contributing to LLM pipeline workflows. I validated a **35,506-record** dataset for schema compliance and evaluated latency-versus-cost trade-offs — work that taught me how data quality and engineering decisions interact in production-oriented systems. This maps directly to MixRank's emphasis on data transformation, modeling, and backend engineering.

At **CloudSire Solutions**, I built **REST API** integrations across Salesforce, Jira, Mailchimp, ServiceNow, Slack, and Outlook — automating data extraction, transformation, and import pipelines end to end. I used **Git** for iterative delivery and debugged distributed data flows across multiple systems. While this was integration engineering rather than core product development, it strengthened my ability to reason about ETL-style workflows and reliable data movement at scale.

I have also shipped full-stack projects independently. My major project, *Bridging Learning Gaps*, is a **Flask** web application with REST endpoints, a browser UI, and a CNN-LSTM inference pipeline that achieved **93.7% accuracy** — I owned the flow from data ingestion through API to user-facing results. Separately, I have built **React** and **JavaScript** applications in academic and personal projects, exploring web development outside of assigned coursework because I genuinely enjoy building things with code.

I want to be direct about where I am still growing. I do not yet have production experience with **PostgreSQL**, **Rust**, or **Nix**, and my systems/infrastructure depth is limited compared to what MixRank operates at scale. I also have not contributed to open-source projects in a sustained way. What I bring is strong Python fundamentals, real internship experience across backend and

data layers, comfort working independently in remote async environments (including Poditivity's early-stage startup), and genuine curiosity about hard technical problems — including a willingness to learn PostgreSQL, Linux tooling, and whatever subset of your stack best matches my contributions.

I am based in **Hyderabad, India** and am applying to the **Global Remote** posting. I understand MixRank also lists country-specific junior engineer roles; I am not applying to those listings as I am based in India.

Thank you for considering my application. I would welcome the opportunity to contribute to MixRank's data products while growing into meaningful technical ownership.

Sincerely,
Sankeerth Masetty
