Cover Letter: Machine Learning Engineer

ParallelDots Remote (Gurgaon HQ) 2026-08-22

I am applying for the Machine Learning Engineer role at ParallelDots. I want to train, deploy, and improve computer vision pipelines that solve real industry problems — not just benchmark models in isolation.

I am a Python engineer with internship experience in computer vision and machine learning. I built Bridging Learning Gaps, a real-time image classification system achieving 93.7% accuracy using OpenCV, MediaPipe, and CNN-LSTM with live inference via a web interface. At Samyama.ai I worked on Transformers-based model components, synthetic data pipelines, and inference latency optimization.

- **Built a real-time computer vision classification pipeline**, achieving 93.7% accuracy with OpenCV, MediaPipe, and CNN-LSTM (github.com/iamsankeerth/Major-Project).
- **Developed Transformers-based model workflows**, with structured data validation across 35,506 training examples at Samyama.ai.
- **Reduced model inference latency by 2.3 seconds**, through architecture changes and targeted debugging of serving workflows.

ParallelDots' FMCG computer vision work needs engineers who can train classification models, understand pipelines end-to-end, and ship reliable inference services. I would contribute with strong Python fundamentals, hands-on CV project experience, and disciplined experimentation. I am actively deepening PyTorch, object detection, and OCR skills to match production FMCG use cases. I am remote-ready from Hyderabad and available to start after completing my current application pipeline priorities.

I would welcome the opportunity to discuss how my computer vision and ML engineering experience can support ParallelDots' classification and detection pipelines.
