Cover Letter: Custom Software Engineer

Accenture Hyderabad 2026-08-11

I am applying for the Custom Software Engineer role (ATCI-5704900-S2062039) at Accenture Hyderabad. I build custom Python software aligned to business requirements, and I want to grow as an engineer inside a delivery organization that values clean code, agile practices, and measurable quality.

I am a Python software engineer based in Hyderabad with internship experience across AI product development, enterprise integrations, and Django web platforms. I work with Django, Flask, and FastAPI, and I have shipped REST API automations, internal collaboration tools, and a computer vision accessibility project that won 2nd prize at Project Expo 2025. My recent work combines object-oriented design, debugging, and cross-functional delivery with the structured engineering habits this role emphasizes.

- **Built a domain-specific Python language model**, processing 35,506 synthetic training examples with JSON schema validation and reducing inference latency by 2.3 seconds at Samyama.ai.
- **Designed REST API integrations across Jira, Salesforce, ServiceNow, and Slack**, automating ~100 tickets weekly and cutting manual support handoffs by 45% at CloudSire Solutions.
- **Delivered a secure Django intranet platform**, with real-time chat, request tracking, admin controls, and two-factor authentication at RCI (Research Center Imarat).
- **Built a Tamil Sign Language recognition system**, achieving 93.7% accuracy with a Flask web interface for live gesture-to-text conversion (github.com/iamsankeerth/Major-Project).
- **Led a 14-person cross-functional team as General Manager**, increasing social media engagement by 40% at Poditivity Connect after promotion from the Founder's Office.

Accenture is scaling AI-native software delivery while clients still need reliable custom application engineering: components that are maintainable, tested, and aligned to business requirements. I would contribute by writing clean Python code, participating in code reviews and defect resolution, and documenting solutions so teams can ship scalable software without rework. On day one, I would map the team's delivery workflow, pick up a well-defined component, and deliver a tested increment that matches the sprint's business requirement.

I am based in Hyderabad and available to start immediately. I would welcome the opportunity to discuss how my Python delivery experience and integration background can support Accenture's custom software engineering teams.
