Cover Letter: Junior Backend Engineer

FactWise Mumbai (Thane / Navi Mumbai) 2026-08-22

I am applying for the Junior Backend Engineer role at FactWise. I build Python backend software that solves business problems with clean APIs, reliable deployments, and fast iteration in agile teams.

I am a Python engineer with internship experience across Django web platforms, enterprise REST API integrations, and production ML components. At RCI I built a secure Django application with real-time workflows. At CloudSire I automated cross-platform integrations from business requirements. At Samyama.ai I delivered maintainable Python services with rigorous data validation and latency optimization.

- **Built a secure Django web platform**, with real-time chat, request workflows, and two-factor authentication at RCI (Research Center Imarat).
- **Designed REST API integrations across enterprise systems**, automating ~100 tickets weekly and cutting manual handoffs by 45% at CloudSire Solutions.
- **Delivered production Python ML components**, with structured validation across 35,506 training examples and 2.3-second latency improvement at Samyama.ai.

FactWise's source-to-pay platform needs backend engineers who can own features end-to-end in Python/Django, collaborate with product and design, and debug customer issues under real usage. I would contribute with strong API integration experience, Django delivery, agile habits, and a problem-solving mindset. I am open to relocating to Mumbai and available to start after my current priority applications progress.

I would welcome the opportunity to discuss how my Python backend and integration experience can support FactWise's product development.
