Cover Letter: Forward Deployed Engineer

Huvo AI Gurgaon 2026-08-22

I am applying for the Forward Deployed Engineer role at Huvo AI. I want to work at the intersection of LLM behaviour, customer deployments, and integrations — designing and testing what ships in production, not just what works in a demo.

I am a Python engineer with internship experience across language-model iteration, enterprise API integrations, and customer-facing delivery. At Samyama.ai I worked on structured model outputs, JSON schema validation, and evaluation loops for a domain-specific language model. At CloudSire I translated business requirements into REST API automations across Jira, Salesforce, ServiceNow, and Slack. At Poditivity I worked with founders and led a 14-person cross-functional team on measurable growth outcomes.

- **Iterated on structured LLM outputs and validation rules**, across 35,506 synthetic training examples with JSON schema testing at Samyama.ai.
- **Reduced model inference latency by 2.3 seconds**, through architecture changes and production-oriented debugging.
- **Built REST API integrations across enterprise platforms**, automating ~100 tickets weekly and cutting manual handoffs by 45% at CloudSire Solutions.
- **Led cross-functional delivery with founders**, increasing engagement by 40% as General Manager at Poditivity Connect.

Forward deployed work needs engineers who can translate messy business rules into testable agent behaviour, configure integrations, and fix production issues under real campaign pressure. I would contribute by designing and testing prompts and workflows with discipline, building reliable API and webhook integrations, and iterating from failure cases until deployments are stable and measurable. I am open to relocating to Gurgaon for in-office work and available to start immediately.

I would welcome the opportunity to discuss how my LLM iteration, integration, and customer-delivery experience can support Huvo AI's voice and conversational agent deployments.
